ABSTRACTED-PUB-NO: JP05141055A
BASIC-ABSTRACT:

The corner moulding material comprises a laminated layer comprising an independent foaming type foaming body comprising a thermoplastic resin, a pressure sensitive adhesive layer and a separator layer.

The thermoplastic resin comprises a polyethylene foaming body, or polypropylene foaming body. The pressure sensitive adhesive comprises a thermoplastic resin, rubber, asphalt, or their mixt. The separator comprises a polyethylene film, polypropylene film, polyethylene terephthalate film or polyvinylidene chloride film.

USE/ADVANTAGE - Used in waterproofing work, including roofs. In using the moulding body, the separator is removed, the moulding body is applied to a corner. The moulding body is familiar with a bed or a wall with slight force. The moulding body is deformed to engage with the corner having a shape different from that of the moulding body. The result insures complete water tightness, causing no water leakage.

ABSTRACT:

PURPOSE: To simplify and secure the fitting work of a ceiling material for vehicle or the like by forming a closed cellular olefinic bridged resin foaming sheet into a shape along the surface shape of a ceiling part, and providing an adhesive attachment part in the back surface of this molded foamed sheet.

CONSTITUTION: A closed cellular olefinic resin foaming sheet is obtained by the extrusion molding. This sheet is irradiated with electron beam by an electron beam accelerating machine, and heated by a hot air heating furnace to foam the sheet. Polypropylene is extruded and laminated on one surface of the foamed sheet to form a polypropylene resin layer to obtain the base material. This base material is cut to pieces each having a specified dimension, and formed into a shape which has a molded surface along the surface shape of a ceiling part of an automobile with a vacuum forming mold, and trimming is performed to the periphery thereof, and a central part of the surface opposite to the polypropylene resin layer is coated with the adhesive agent to form an adhesive attachment part, and a releasing paper is temporarily fitted thereon to protect an adhesive agent layer 3. Attachment type molded ceiling material is thereby obtained.
